

Quarterly Activities Report January to March 2011.

The induced polarisation geophysical survey at Lyndon Station planned for the March quarter has been unavoidably delayed, initially by widespread rain and flooding in the Gascoyne and neighbouring regions of Western Australia. Long deferrals in the availability of geophysical and drilling contractors have resulted. The contractor booked for the Company's survey was not able to commence at the agreed time. The survey is now scheduled for the second half of May. Conditions will then be much more suitable for surveying by electrical geophysical methods.

The company has been evaluating several advanced gold and base metal exploration projects in Australia, principally Western Australia, and the southwest Pacific. The objective is to acquire interests in advanced exploration tenements with potential for gold deposits of greater than 500,000 ounces. These evaluations are continuing.

About Lyndon Station

The 100% owned Lyndon gold, silver and copper prospects are located in the Gascoyne Region of Western Australia approximately 300km northeast of Carnarvon. Four contiguous tenements (3 granted, 1 application) of 652 square kilometres contain a cluster of high grade workings dating back to the 1950's.
