Exploration update

New prospective target area identified from site visit & desktop review of Lyndon Gold & Copper Project

Highlights

- **Site visit and review of Lyndon Gold & Copper Project completed**
- **New prospective 'Bull's-eye' anomaly on neighbouring ground identified and pegged by the Company**
- **Project maintenance costs reduced through dropping of less prospective ground**

Integrated Resources Group Limited (ASX: **IRG**, "**IRG**", "**the Company**") wishes to announce that it has completed a site visit and desktop review of its Lyndon Gold & Copper Project ("Lyndon Project").

A number of recommendations have been made following the review with actions taken including:

- the Company has applied for neighbouring exploration ground in order to expand its tenement package to incorporate an identified magnetic 'Bull's-eye' anomaly; and
- the Company has voluntarily surrendered ground identified as un-prospective in order to reduce the holding costs for the project going forward.

The site visit to the Lyndon Project was undertaken at the end of May 2013 and involved an inspection of the tenements, including the Lyndon Bettina pits and the locations of prior RC drill holes, and an inspection of RC drill chips stored near the project site. Following the site visit a desktop review of historical exploration was conducted which included RC drilling data, geochemical sampling (via RAB drilling) and Induced Polarisation survey data on the Lyndon Bettina and Broken Thumb prospects and a review of historic aero magnetic survey data.

The Review identified a 'Bull's-eye' magnetic anomaly target to the south of the Project (refer to **Figure 1**). The Company has applied for and been granted an extension to the Project area to cover this anomaly.

In conjunction with the application for new ground, the Company has voluntarily surrendered a number of northern blocks within E08/2066 and northern and western blocks within E08/2022 that were identified from the Review as un-prospective. Including the additional ground granted, this area reduction has resulted in a net reduction in the total area of the project, which will reduce the tenement holding costs to the Company going forward. Refer to **Figure 2** for a map showing the changes to the Project area.

The Review has made a number of recommendations for future work that includes a ground magnetic survey on the Lyndon Bettina Prospect and the new Bull's-eye target and conduct further reconnaissance and rock chip sampling on the Broken Thumb – Thirty Bob structure. The Company is considering future exploration and will update shareholders in due course.

New Opportunities

The Board is continuing to evaluate a number of new resource opportunities and is currently conducting initial due diligence on one such project. The Board is committed to establishing a resource project portfolio in order to increase shareholder value and will update shareholders as opportunities develop.

On behalf of the Company

Timothy J. Moore
Chairman

<End of Announcement>

About the Lyndon Project

The 100% owned Lyndon gold, silver and copper prospects are located in the Gascoyne Region, approximately 300 km northeast of Carnarvon. Three contiguous granted tenements contain a cluster of high grade workings dating back to the 1950's that had not been drilled at depth nor explored by modern techniques.
